

The Most Valued Name in Investigations Solutions

By Cai Broughton, | December 13th 2017 –

T

he verdict is in on NUIX's Investigator Software. Wherever the software is tried

and tested, positive testimony and praise are soon to follow. From Public Agencies, Law Enforcement, Law and Order and the Judicial System. To Private Sector Players in Telecommunications, Law, Auditing, Accounting, and More, all over the world. NUIX's beginnings down under in Australia, may give it an appearance that's far removed from the tech heavy firms within the United States, but in this modern age of global digital communication, NUIX finds a way to prove its consistency is its charm. Consistency in performance power, scope of services and scalable adaptability, allowing it to fit and function in any company or set up.

Vodafone, a major multinational telecom provider, needed a way to conduct internal investigations on a company wide scale. With over one hundred thousand employees on their books, Vodafone had no choice but to turn to the heavyweight of the digital investigation industry.

High Tech Crime Unit Detective Nigel Jeffries stated:

"Nuix will give us a lot more control over the processes."... "I knew Nuix was what we needed, and we conducted a proof of concept, wrote a business case, and had the purchase order approved within a few weeks."

The team under Jeffries and his fellow detectives were able to cut the handling time of forensic processing backlogs significantly.

"Vodafone's digital investigation team can now complete tasks in hours that previously took days or longer"..."We've currently no backlog—we just do the work as it's presented to us," said Jeffries."

Investigating the fraud present in a single company is one thing, but simultaneously comparing and indexing the case information from both government and private sector entities is another.

The Guernsey Police, hailing from the small English Channel Island, frequently take on such a challenge. The island has become a center for fund management. But where there is business there is fraud, and the local police force and border agency turned to NUIX and their investigator software to enforce the difficult to administer law.

Detective Inspector Andy Domaille explained the task they were facing.

"We were dealing with international companies with operations around the globe, and had to try and prove a case based on emails, documents, server contents," Domaille said. "None of our existing tools were up to the job, so we began looking into ways to deal with it."

The scope and scale of NUIX was put to the test with positive results.

"Early demonstrations made it clear that Nuix Investigator Lab could easily handle the varied types of data facing the investigators. In addition, it could provide the top-down view that was essential in discovering often carefully hidden relationships between investigated entities."

But NUIX didn't just stop there. Providing clients with a solution to problems as they evolve is the NUIX way. Support came in, in the form of additional customization and consultation.

The Nuix team have been absolutely superb, and I take my hat off to Nuix for solving any problems,"

With results like these, no-one could possibly argue with the fact that NUIX investigator software has become the favored solution for investigations teams from any background.
